

6.7 Exponential Growth

Exponential Growth: Comparing Functions

Compare the graphs on each grid, list and explain their differences and similarities.

Formula: $P(n) = P_0(1+r)^n$

\Rightarrow $P(n)$: final amount (number) P_0 : initial amount (number)
 r : growth rate n : number of growth periods

When the base $(1+r)$ is greater than 1: growth

Ex 1:

According to the 1991 census, the region of Niagara, Ontario, had 364 552 residents. For the next few years, the population grew at a rate of 2.2% per year. For planning purposes, the regional government needs to determine the population of the region in 2010. The algebraic model for this case is: $P(n) = P_0(1+r)^n$

a) What is the initial population, P_0 ?

364 552

b) What is the growth rate r of the population?

2.2% per year $\Rightarrow 0.022$

c) How many growth periods are there?

$\frac{2010-1991}{1} = 19$ $\therefore 19$ periods

d) Write the algebraic model for this situation.

$$P(n) = 364552(1+0.022)^n$$

e) Use the model to determine the population in 2010.

$$\begin{aligned}
 P(19) &= 364552(1.022)^{19} \\
 &= 551222
 \end{aligned}$$

\therefore The population will be approx.
551 222 in 2010

Real World Applications

1. You can calculate the amount of money you have in your investment account after a given number of years using the formula $A = P(1+i)^n$ where A is the amount in \$ you will have, P is the principal (initial amount of money invested), i is the interest rate per year and n is the number of years.

a) Complete the table of values for your \$5000 invested at 4.5%/a.

b) When will you have \$ 5705 ? after 3 yrs

c) When will you have \$6095 ? approx. 4.5 yrs

d) This is an example of exponential growth

$$i = 0.045$$

n	A
1	5225
2	5460.13
3	5705.83
4	5962.59
5	6230.91

$$P = 5000$$

$$A = 5000(1+0.045)^n$$

Ex 2: (p 430 #8)

Mari invests \$2000 in a bond that pays 6% per year.

a) Write an equation that models the growth of her investment.

$$A = 2000(1 + 0.06)^n$$

Where A is the final amount
 n is the # of years

b) How much money does she have if she cashes the bond at the end of the 4th year?

$$n = 4 \quad A = 2000(1.06)^4 \\ = 2524.95$$

\therefore She has \$2524.95

c) How much will the bond be worth at the end of the 5th year?

$$n = 5 \quad A = 2000(1.06)^5 \\ = 2676.45$$

\therefore She has \$2676.45

How can you determine the amount earned **during** the **5th** year?

$$= 2676.45 - 2524.95 \\ = 151.50$$

e) Determine the amount Mari will earn at the end of the 20th and 21st year and the amount made **during** the **21st** year

f) Compare the money earned **during** the **5th** and **21st** years. What does this tell you about exponential growth?

Ex 3: (p 431 #10)

An ant colony triples in number every month. Currently, there are 24000 in the nest.

a) What is the monthly growth rate of the colony?

triples = $\times 3$
 ex. $24000 \cdot \underbrace{3^x}_{1+r}$ $\rightarrow r = 2$
 $\therefore 200\%$ growth rate

b) What is the initial population?

$$24000$$

c) Write an equation that models the number of ants in the colony, given the number of months.

$$p(n) = 24000(3)^n$$

d) Use your equation to predict the size of the colony in three months.

$$\begin{aligned} p(3) &= 24000(3)^3 \\ &= 648\,000 \end{aligned}$$

e) Use your equation to predict the size of the colony five months ago.

$$\begin{aligned} p(-5) &= 24000(3)^{-5} \\ &= 99 \end{aligned}$$

★ Ex 4 A certain strain of yeast cell doubles under certain conditions every 20 minutes. If there were 350 initially, how many cells will there be in 3 hours?

① Eqn

$$P_0 = 350$$

Doubles every 20 min

After 3 hours?

$$P(n) = 350(2)^n, \quad n \text{ is the \# of 20 min. periods}$$

$$P(n) = 350(2)^{\frac{n}{20}}, \quad n \text{ is minutes}$$

$$\begin{aligned} P(180) &= 350(2)^{\frac{180}{20}} \\ &= 350(2)^9 \\ &= 179200 \end{aligned}$$

$$\begin{aligned} &\left\{ \begin{array}{l} 3 \text{ hours} \\ = 180 \text{ min} \\ \\ \frac{180}{20} = 9 \text{ 20 min. per.} \end{array} \right. \end{aligned}$$

∴ There will be
179 200 cells.
